$$v(t) = s'(t) = 3t^2 - 3t - 21$$

$$a(t) = v'(t) = 6t - 3$$

(b) $v(t) = 0 \iff 3(t^2 - t - 7) = 0$

$$\iff t = \frac{1 \pm \sqrt{(-1)^2 - 4\cdot(-7)}}{2} = \boxed{\frac{1 \pm \sqrt{29}}{2}}$$

(5) $f(x) = x^3 - 12x$

$V = \frac{4}{3}\pi r^3$

$\Rightarrow V' = \frac{4}{3}\pi \cdot 3r^2 \cdot r'$

At key moment:

$60 = \frac{4}{\cancel{3}}\pi \cdot \cancel{3} \cdot 5^2 \cdot r'$

$= 100\pi r'$

$\Rightarrow r' = \frac{60}{100\pi} = \boxed{\frac{3}{5\pi}}$

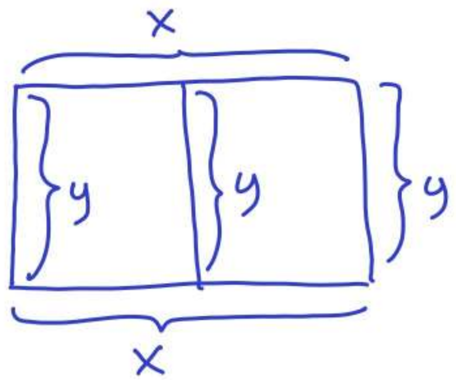
radius is growing by $\frac{3}{5\pi}$ in. per minute.

At key moment:

$V' = 60$ (in^3/min)

$r = 5$ (in.) since diam = 10

7



amount of fence $= 2x+3y = 1200$

Area $= A = xy$

We can solve for y to write A as a function of x alone:

$$3y = 1200-2x$$
$$y = 400-\tfrac{2}{3}x$$

$$A(x) = x\cdot\left(400-\tfrac{2}{3}x\right)$$

feasible values of x: $\quad x\geq 0$ & $y\geq 0$

$\iff x\geq 0$ & $\frac{2}{3}x \leq 400$

$\iff x\geq 0$ & $x\leq 600$

So the interval is $[0, 600]$.

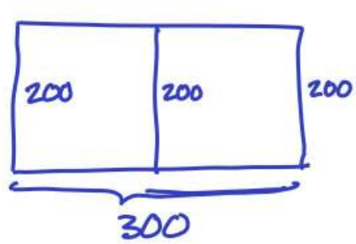
We want the max of $A(x) = x\left(400-\frac{2}{3}x\right)$ on $[0,600]$. We can use the closed interval method:

$$A'(x) = 1\cdot\left(400-\tfrac{2}{3}x\right) + x\cdot\left(-\tfrac{2}{3}\right) = 400-\tfrac{4}{3}x$$

$\Rightarrow$ crit. pt. where $\quad 400 = \frac{4}{3}x \iff \underline{x=300}$

$$A(0) = 0\cdot 400 = 0$$
$$A(300) = 300\cdot 200 = 60{,}000 \leftarrow \underline{\text{max.}}$$
$$A(600) = 600\cdot 0 = 0$$

So the optimal dimensions are $x=300$, $y=200$



8. $S(t) = 3t^2 - t^3$

(a) $\text{avg. rate} = \dfrac{\text{total snowfall}}{\text{time}} = \dfrac{S(2) - S(0)}{2-0}$

$$= \frac{3 \cdot 2^2 - 2^3 - 0}{2} = \frac{4}{2} = \boxed{2} \quad \text{inches/hour.}$$

(b) $S'(t) = 6t - 3t^2$

$\text{rate @ 30 min.} = \text{rate @} t = \frac{1}{2} = 6 \cdot \frac{1}{2} - 3 \cdot \left(\frac{1}{2}\right)^2 = 3 - 3/4$

$$= \boxed{\frac{9}{4}} \text{ in./hr.}$$

(c) We want the maximum value of $S'(t) = 6t - 3t^2$ on $[0, 2]$.
Using the closed interval method:

$$S''(t) = 6 - 6t, \text{ which is } 0 \text{ @ } t = 1.$$

Test $t = 1$ & endpoints:

$$S'(0) = 6 \cdot 0 - 3 \cdot 0 = 0$$

$$S'(1) = 6 \cdot 1 - 3 \cdot 1 = 3 \leftarrow \text{max.}$$

$$S'(2) = 6 \cdot 2 - 3 \cdot 4 = 0$$

So the snow was falling fastest at $t = 1$ (halfway through the storm), when it was falling at an instantaneous rate of 3 inches per hour.

(9) $f(x) = \dfrac{x^3}{(x-1)^2}$

(a) $f'(x) = \dfrac{3x^2(x-1)^2 - x^3 \cdot 2(x-1)}{((x-1)^2)^2} = \dfrac{x^2(x-1)\cdot[3(x-1)-2x]}{(x-1)^4}$

$= \dfrac{x^2\cancel{(x-1)}(x-3)}{(x-1)^{\cancel{4}3}} = \dfrac{x^2(x-3)}{(x-1)^3}$

(b) num. is 0 @ $x=0$ & $x=3$
undef. (denom 0) @ $x=1$

Critical numbers are $\underline{0, 1, \& 3}$.

(c) The "local max/min/neither" question is not relevant at $\underline{x=1}$, since $f(x)$ itself is not defined there.

(d) Sign analysis.

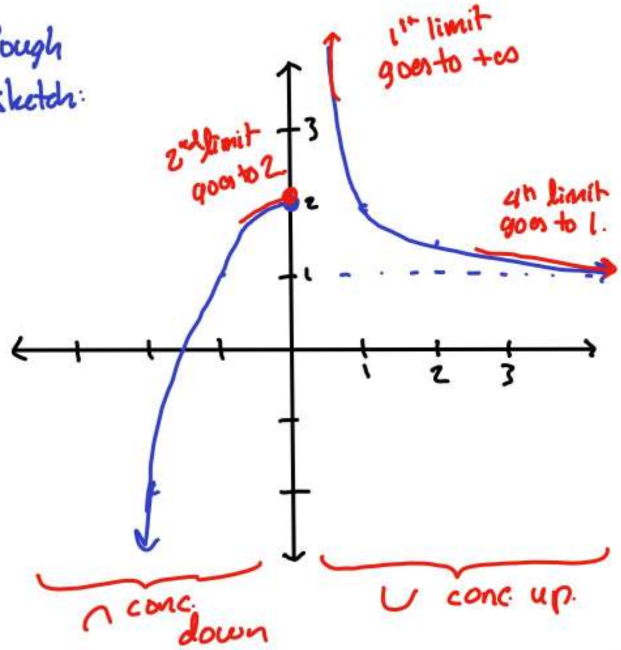
(10) $g(x) = \begin{cases} 2-x^2 & x \le 0 \\ 1+\frac{1}{x} & x > 0 \end{cases}$

(a) Rough sketch:



How to draw this: $\underline{2-x^2}$ is like $y=x^2$, but vertically flipped & then translated up 2 units. (draw for $x \le 0$)

$1+\frac{1}{x}$ is like $y=\frac{1}{x}$, but translated up one unit.

(b) $\lim_{x \to 0^+} g(x) = +\infty$ (see red marks above for how to see these in the graph).

$\lim_{x \to 0^-} g(x) = 2$

$\lim_{x \to 0} g(x)$ does not exist, since the one-sided limits disagree.

$\lim_{x \to \infty} g(x) = 1$.

(c) As drawn above, the graph is concave down for $x < 0$ & concave up for $x > 0$.

The concavity changes @ $x=0$, but this is not considered an inflection point since it is a discontinuity of the graph (infinite discontinuity).
